ImmunoBlitz Exit Ticket

Quick Assessment - Infection, Immunity and Scientific Models

Name: _____ Class: _____ Date: _____

Instructions: Answer all six questions. Use short scientific explanations rather than single words where possible.

1. Name one type of pathogen found in ImmunoBlitz and explain one important feature of it.

Examples may include viruses, bacteria or fungi.

2. Give one example of a first-line body defence and explain how it helps reduce infection.

Think about barriers such as skin, mucus, tears, saliva or stomach acid.

3. What is one role of white blood cells or other immune cells in defending the body?

You may refer to engulfing pathogens, coordinating responses, antibodies or immune memory.

4. Why should antibiotics not be used to treat a viral infection?

Explain the biological reason, not only the rule.

5. How is vaccination different from waiting until an infection has already become serious?

Think about immune preparation and memory.

6. Give one example of something ImmunoBlitz simplifies compared with real biology. Why can that simplification still be useful for learning?

Examples: waves, visible pathogens, health bars, instant upgrades or simplified interventions.

Before you hand this in:

Check that you used at least one scientific reason and identified one difference between the game and real biology.
