IMMUNOBLITZ

Gameplay Investigation Worksheet

Play - Observe - Explain

Name: _____ **Class:** _____ **Date:** _____

Learning focus

Use the game as evidence. Notice what happens, explain why you made each decision, and separate game strategy from real biology.

1 Before You Play

A. What do you already know about how the body protects itself from pathogens?

B. Which defence or intervention do you predict will be most useful in the game? Why?

2 During Gameplay: Record Three Decisions

Pathogen / threat	Defence or intervention	What happened?	Why did you choose it?
Decision 1			
Decision 2			
Decision 3			

Strategy checkpoint

One decision I made mainly because of science:

One decision I made mainly because it helped me win the game:

3 Game vs. Real Biology

Choose ONE ImmunoBlitz mechanic (for example: waves, health bars, upgrades, pathogens, vaccines, antibiotics or natural barriers) and evaluate it as a scientific model.

Game mechanic I chose:

What real biological idea is this mechanic trying to represent?

What has the game simplified, exaggerated or left out?

What might a player incorrectly assume if nobody explained the simplification?

How could the mechanic be improved without making the game too complicated?

4 After Playing: Reflect

One thing I learned or understood better:

One thing the game represents well:

One thing the game simplifies:

One question I still want to investigate:

Remember: ImmunoBlitz is a simplified educational model. Game mechanics can help us ask questions, but they are not a literal simulation of human biology.
